

Long term national energy planning

Municipal Utilities 2030

Strategies for planning and sustainability

April 8, 2010

James D. McCalley

Harpole Professor of Electrical &

Computer Engineering

Iowa State University

Outline

1. Winds of change
2. The US Energy System
3. Possible Futures for the US
4. Needs for new planning tools

Winds of change: US Wind Resources

Total onshore energy potential is 62PWhr which is $2.1 \times$ Total annual US energy consumption of 100 Quads

20x20 DOE Report: "The nation has more than 8,000 GW of available land-based wind resources that industry estimates can be captured economically ." (~24.5 PWhrs)

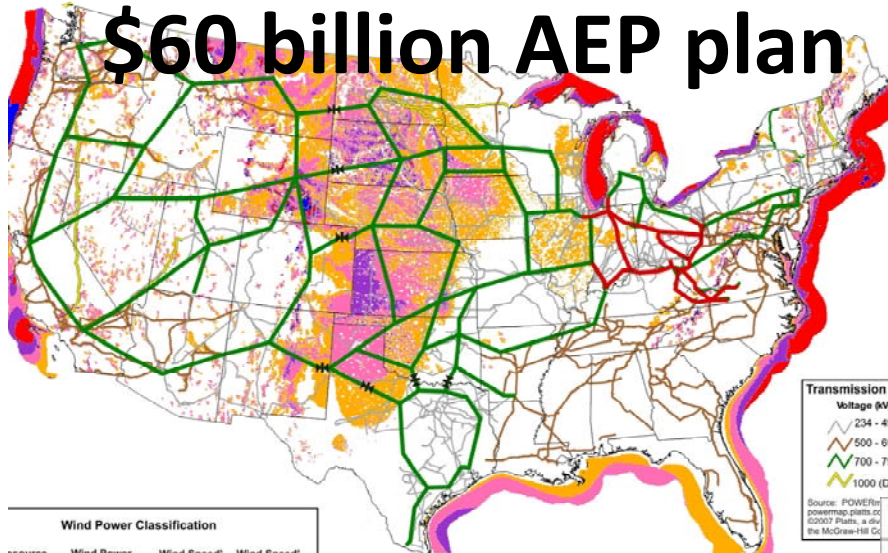

Analysis assumes (a) sites having capacity factor > 20% included; (a) loss of 20% and 10% of potential power for onshore and offshore, respectively, caused by interturbine interference, (c) offshore siting distance within 50 nm (92.6 km) of nearest shoreline.

Wind Power Classification

resource potential	Wind Power Density at 50 m W/m ²	Wind Speed* at 50 m m/s	Wind Speed* at 50 m mph
air	300 - 400	6.4 - 7.0	14.3 - 15.7
ood	400 - 500	7.0 - 7.5	15.7 - 16.8
xcellent	500 - 600	7.5 - 8.0	16.8 - 17.9
utstanding	600 - 800	8.0 - 8.8	17.9 - 19.7
uperb	800 - 1600	8.8 - 11.1	19.7 - 24.8

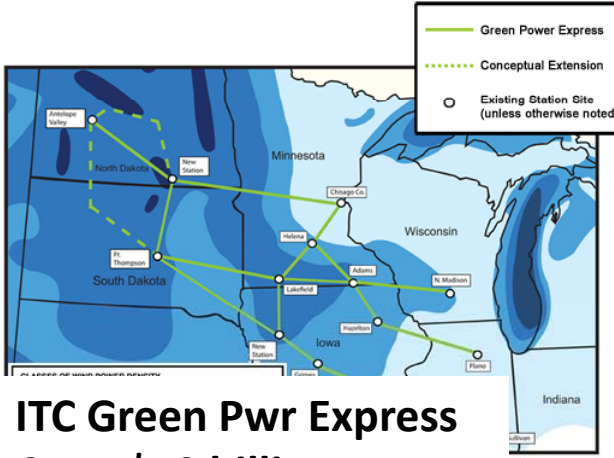

Notes: * based on a Weibull k value of 2.0

This map shows the wind resource data used by the WinDS model for the 20% Wind Scenario. It is a combination of high resolution and low resolution datasets produced by NREL and other organizations. The data was screened to eliminate areas unlikely to be developed onshore due to land use or environmental issues. In many states, the wind resource on this map is visually enhanced to better show the distribution

EWITS Scenario 1. Cost: \$156 billion (2024 \$)

Scenario 1 Lines by kV
 230 (13)
 345 (47)
 400 (13)
 500 (22)
 765 (81)
 800 (32)

ITC Green Pwr Express Cost: \$10 billion

Energy System: Transport goes electric!

A modified French high-speed train has set a new world speed record for a train on conventional rails of 357 mph.

World's first all-electric locomotive has over 1,000 batteries, runs 24 hours on a single charge.

In 2008, Warren Buffet's MidAmerican Energy Holdings bought 9.9% of BYD for \$232 million.

And in 2009 Warren bought BNSF!

Rail ROW

- Cost of an 800 kV HVDC line about \$3M per mile
- Cost of converter stations land-multiple acres-negotiated
- ROW share from 15% in Missouri to about 50% on the east coast
- Annual fixed return on investment 12-13%.
- \$260M/yr for two 1200 mile ROW minimum. Could have 7 lines or more.

40-year national modeling process

- Do we have a way to probe the future?
- Is our dialogue and legislation informed?

US Energy system: Electric, Fuels, Transportation

Energy system: Today

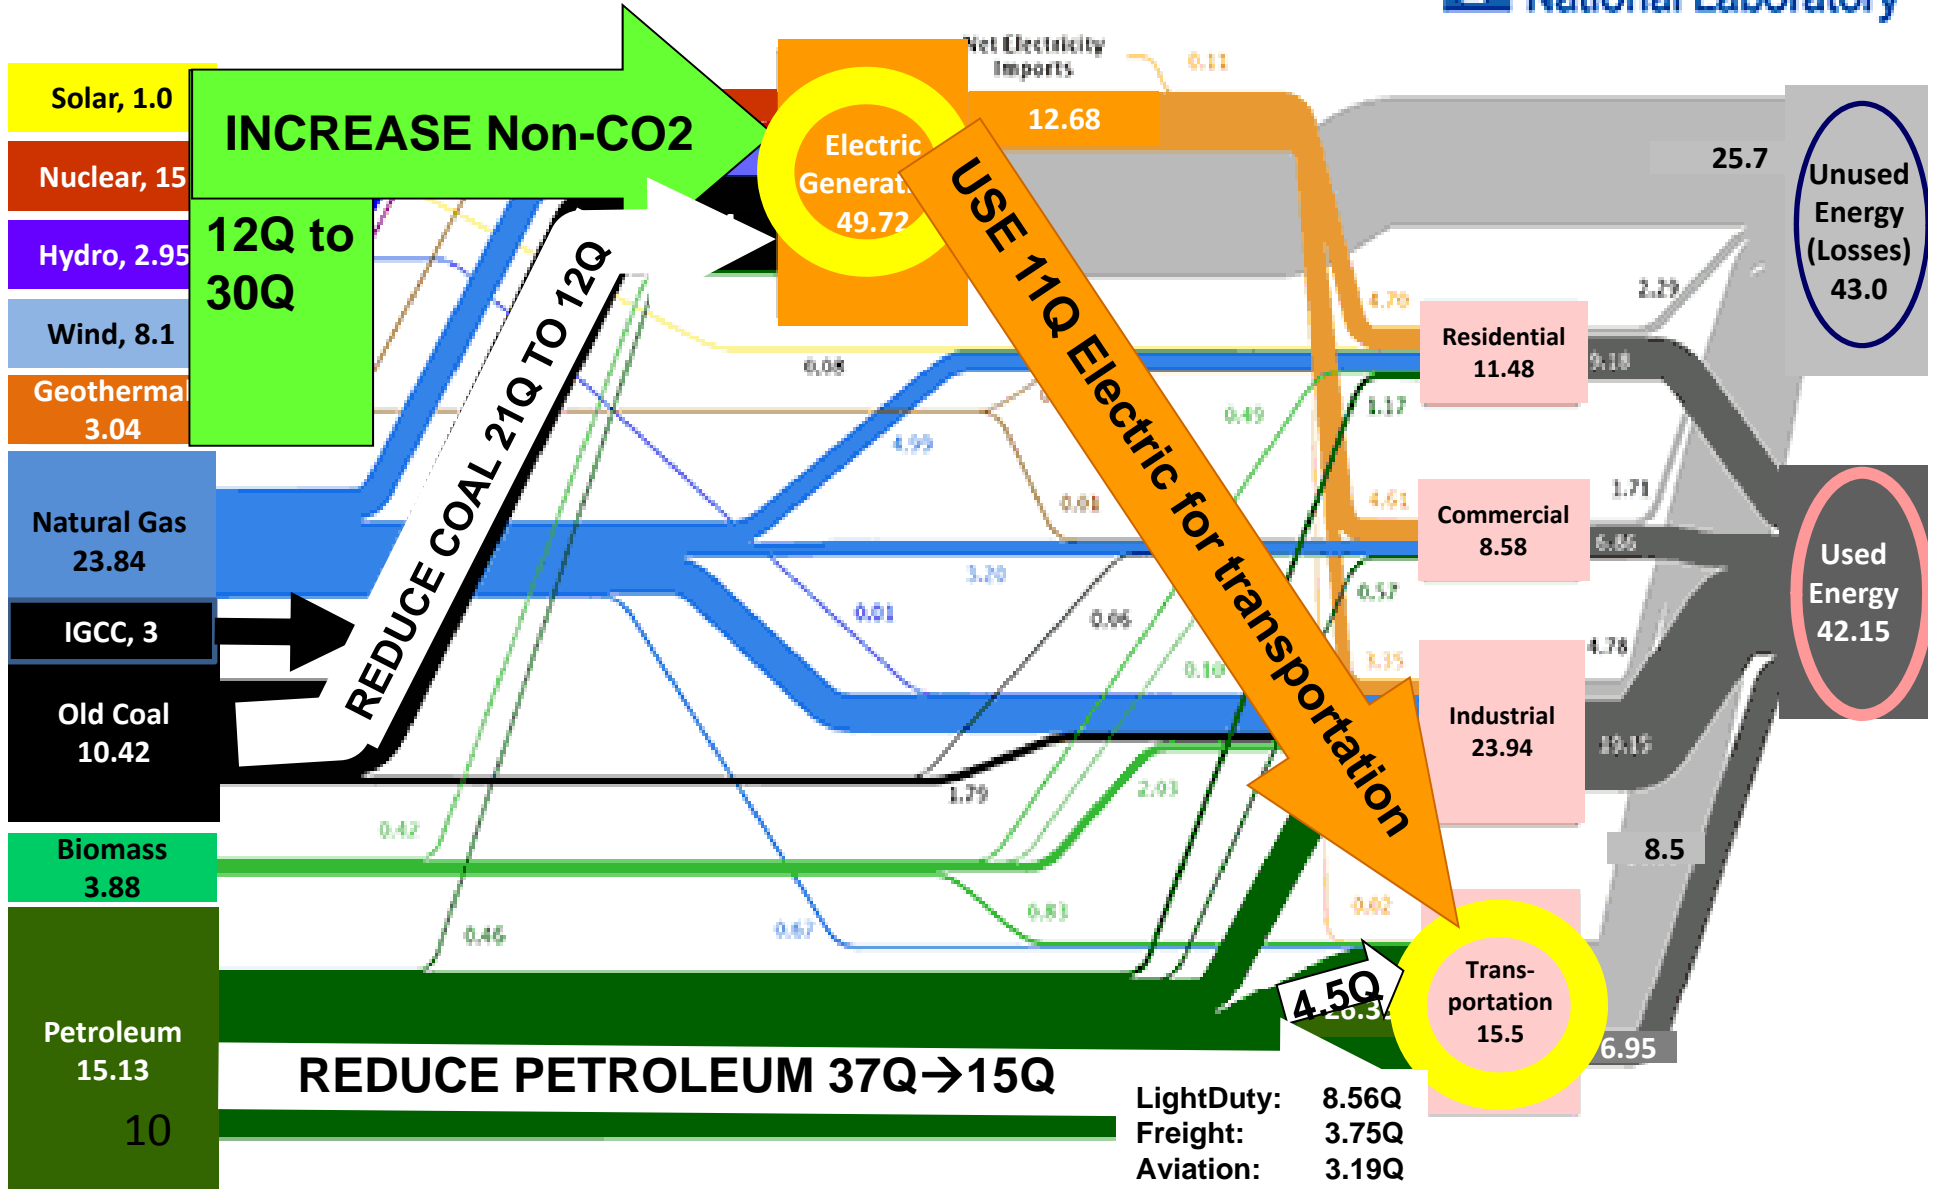

**US ENERGY USE IS 68% ELECTRIC &
TRANSPORTATION**

**GREENING ELECTRIC & TRANSPORTATION ENERGY
SOLVES THE EMISSIONS PROBLEM**

**US CO2 EMISSIONS IS 74% ELECTRIC &
TRANSPORTATION**

A possible future

Estimated U.S. Energy Use in 2008: ~99.2 Quads

A possible future: Why do we reduce losses?

Coal-fired
power plants

Internal
combustion
engines

Because we
reduced the
use of
combustion!

A possible future: emissions

- Decrease coal 21Q→12Q
- Decrease petroleum 37Q→15Q
- Increase Non-CO₂ by 12Q→30Q (Wind 30GW→700GW)
- Use 11Q to electrify transportation

→TOTAL CO₂ REDUCTION=2717 MMT CO₂

→A 37.3% reduction over 2007 emissions.

→Achieving this worldwide by 2035 results in a 75% chance of not exceeding the 2° guardrail.

Investment cost: \$2.9trillion+cost of electrification

Annual savings in production cost: \$264 billion

Unit Costs	Technology	Overnight cost \$/kW
	Concentrated Solar	5021
	PV Solar	6038
	Nuclear	3318
	Wind onshore	1923
	Wind offshore	3851
	Geothermal	4000*
	Coal conventional	2058
	Clean coal (IGCC+seq)	3500
	Biomass	3766
	NGCC	962

* Adjusted from EIA data, which gives cost of least expensive plant, which is \$1711

Planning tools: what we need

1. Long-term (40 years) w/uncertainty representation
2. Multi-sector:
Energy: fuels, conversion, transport, end-use
Transportation: commodity & passenger
3. *Policy-driving*: optimization
4. Multiobjective: cost, emissions, resiliency
5. Modeling granularity: identifies physical infrastructure

PROJECT OBJECTIVES:

- 1. Identify & model de novo infrastructures**
- 2. Develop assessment metrics for cost, resiliency, and sustainability**
- 3. Formulate multi-commodity network flow/multi-objective program**
- 4. Study interdependencies between energy and transportation systems**
- 5. Provide 40-year national modeling process**
